

BOXX STRUCTURES

A Classic Design with a Modern, Efficient Approach.

The innovative BOXX structure is designed with right angles, allowing for optimal use of available space. Created primarily for conferences and exhibitions, its versatility serves various functions, depending on customer needs.

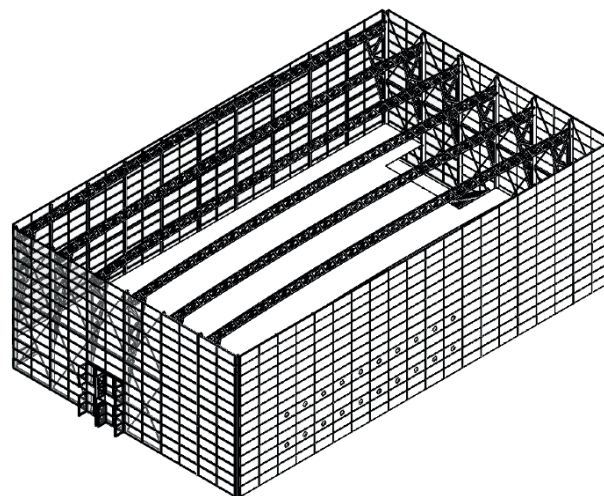

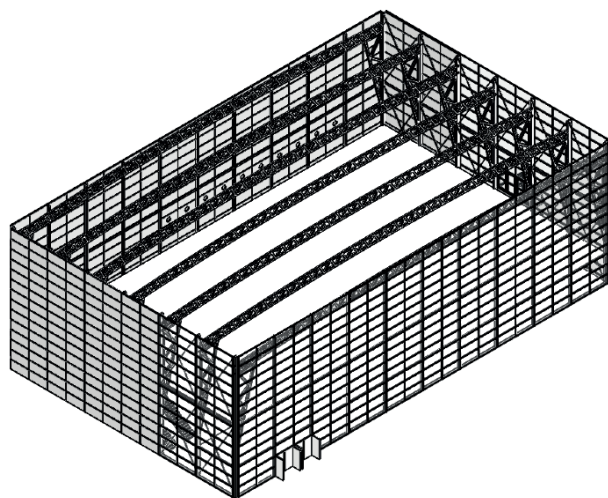

The interior of the BOXX structure can accommodate an additional level at a height of 3 meters, made accessible by an external staircase. This significantly increases event possibilities for the space.

The use of sandwich panel walls allows for easy adjustment of glass windows, controlling the amount of natural light. Modifications can also be made for the number of doors, increasing spatial layout.

The roof, made of an inflated membrane, enhances the aesthetics of the structure. A specially designed gutter system is hidden within the base, allowing the structure to maintain a clean and modern look. Built from modular aluminum frames, the BOXX structure is designed for quick assembly, with little to no ground preparation needed.
